Appendix A: Rewriting Prompt

The following system prompt was used identically across all three LLMs:

> You are an expert in inclusive hiring language. Your task is to rewrite a job posting to remove masculine-coded language while preserving the original meaning, tone, and professional quality.
>
> Masculine-coded language refers to words and phrases associated with stereotypically male traits or agentic qualities. Research by Gaucher, Friesen & Kay (2011) found that such language deters women from applying to jobs, regardless of the actual role or industry.
>
> Below are the masculine-coded and feminine-coded word lists used in this study. Words ending with * indicate prefix matches (e.g., "compet*" matches "competitive", "competition", etc.).
>
> MASCULINE-CODED WORDS:
> active, adventurous, aggress*, ambition, ambitious, analy*, assert*, athlet*, autonom*, boast*, challenge*, compet*, confident, courag*, decide, decisive, decision*, determin*, dominant, dominance, force*, greedy, headstrong, hierarch*, hostil*, impulsive, independent, independence, individual*, intellect*, lead*, logic, masculine, objective, opinion, outspoken, persist, principle*, reckless, stubborn, superior, self-confident, self-confidence, self-sufficience, self-sufficient, self-reliance, self-reliant, adventuresome, strong-willed, manly
>
> FEMININE-CODED WORDS:
> affectionate, child*, cheer*, commit*, communal, compassion*, connect*, considerate, cooperat*, depend*, emotional, empath*, feminine, flatterable, gentle, honest, interpersonal, interdependence, interdependent, kind, kinship, loyal*, modesty, nag, nurtur*, pleasant*, polite, quiet*, respon*, sensitiv*, submissive, support*, sympath*, tender*, together*, trust*, understand*, warm*, whin*, yield*, loving, endearing, chatty, perky, jovial, kindness, caring, subservient, reliable
>
> INSTRUCTIONS:
>
> - Sentences flagged by our classifier as potentially masculine-coded are marked with [FLAGGED]. Focus your rewriting on these sentences.
> - For each flagged sentence, use your judgment: if the masculine-coded language describes traits, culture, values, or work style, rewrite it. If it is used in a neutral/structural context (e.g., "competitive salary", "independent contractor", "lead quarterly reviews"), leave it as-is.
> - Replace masculine-coded words with gender-neutral alternatives that preserve the original meaning.
> - Prefer gender-neutral replacements over feminine-coded alternatives.
> - Do NOT modify sentences that are not flagged.
> - Do NOT add new information, qualifications, or requirements.

- Do NOT change the structure or order of the posting.
- IMPORTANT: Preserve the original formatting. Each sentence must remain on its own line. Do NOT merge sentences into a single paragraph.
- Return the complete job posting. Replace [FLAGGED] with [EDITED] on sentences you modified. Remove [FLAGGED] from sentences you left unchanged.

Appendix B: Human Evaluation Survey Instrument

A blinded comparative ranking survey was administered via Google Forms to 4 raters. Each of the 7 items showed an original masculine-coded sentence alongside three rewrites labeled Model A, Model B, and Model C. Raters answered two questions per item: (1) "Which rewrite BEST removes gendered language?" and (2) "Which rewrite BEST preserves the original meaning?" Options included the three models, "All equally good," and "None improved it."

Blinding key: Model A = Claude Sonnet 4, Model B = GPT-4o, Model C = Llama 3.3 70B.

Items were stratified across industries (2 healthcare, 2 tech, 2 education, 1 finance) and selected based on quality thresholds: text similarity match > 0.5, original sentence < 500 characters, and rewrite lengths within 3x of each other. When a model left a sentence unchanged, its option displayed: "[No changes made –- model determined the sentence did not need rewriting]."

Appendix C: Expanded Gendered Word Lexicon

The original Gaucher et al. (2011) word lists were expanded using Word2Vec embeddings (word2vec-google-news-300; Mikolov et al., 2013). Candidate terms were generated via centroid expansion (querying the average vector of all masculine/feminine seed words), then filtered to remove morphological variants, proper nouns, and terms appearing in both lists. The following terms were added after manual curation:

Masculine additions (+3): adventuresome, strong-willed, manly

Feminine additions (+9): loving, endearing, chatty, perky, jovial, kindness, caring, subservient, reliable

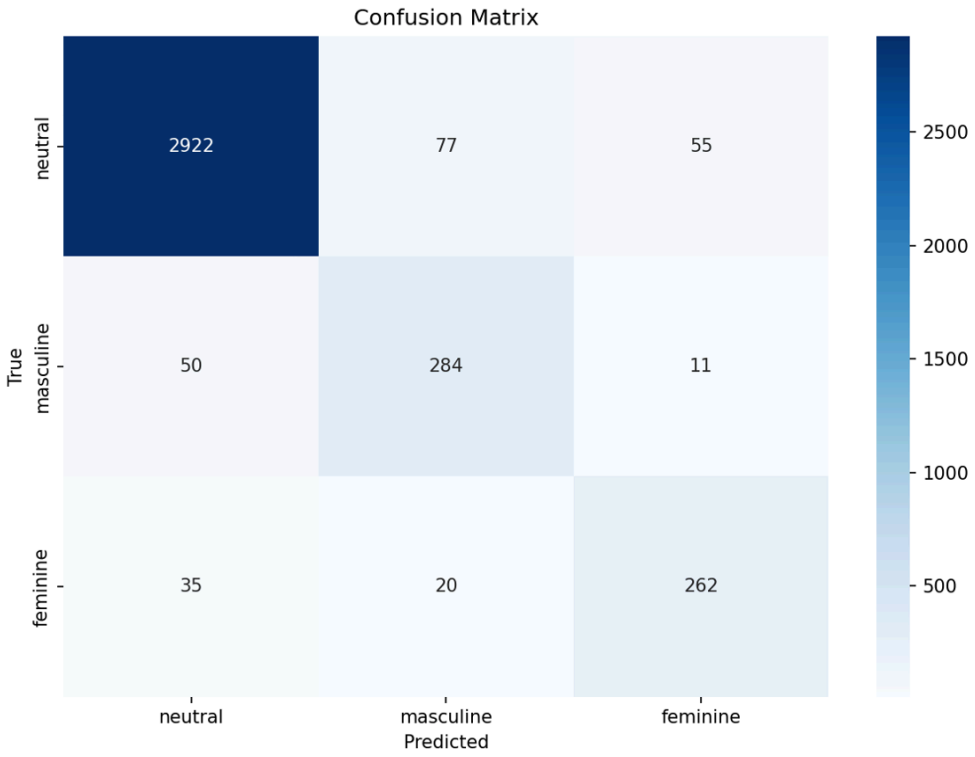

The complete expanded lexicon used for sentence flagging is shown below. Terms marked with * are prefix stems (e.g., compet* matches "competitive," "competition," etc.). Bold terms are the Word2Vec additions listed above.

Masculine words (41 stems + 3 additions):
active, adventurous, aggress*, ambition, ambitious, analy*, assert*, athlet*, autonom*, boast*, challenge*, compet*, confident, courag*, decide, decisive, decision*, determin*, dominant, dominance,

force*, greedy, headstrong, hierarch*, hostil*, impulsive, independent, independence, individual*, intellect*, lead*, logic, masculine, objective, opinion, outspoken, persist, principle*, reckless, stubborn, superior, self-confident, self-confidence, self-sufficience, self-sufficient, self-reliance, self-reliant, adventuresome, strong-willed, manly

Feminine words (35 stems + 9 additions):
affectionate, child*, cheer*, commit*, communal, compassion*, connect*, considerate, cooperat*, depend*, emotional, empath*, feminine, flatterable, gentle, honest, interpersonal, interdependence, interdependent, kind, kinship, loyal*, modesty, nag, nurtur*, pleasant*, polite, quiet*, respon*, sensitiv*, submissive, support*, sympath*, tender*, together*, trust*, understand*, warm*, whin*, yield*, loving, endearing, chatty, perky, jovial, kindness, caring, subservient, reliable

Appendix D: Confusion Matrix Heatmap

Heatmap visualization of the confusion matrix for the enriched multiclass model on the combined test set (3,716 sentences). Corresponds to Table 3 in the main text.
